

ABSTRACT OF THE DISCLOSURE

A first line head **1** and a second line head **2** are arranged in a scanning direction **X**. In each of the line heads **1** and **2**, actuator blocks **40** are arranged at a constant interval in a head longitudinal direction **Y** so as to be spaced apart from one another. The actuator block **40** of the second line head **2** is located between the actuator blocks **40** and **40** of the first line head **1** with respect to the head longitudinal direction **Y**. The actuator block **40** of the first line head **1** and the actuator block **40** of the second line head **2** partially overlap with each other with respect to the head longitudinal direction **Y**.
